As a follow-up to our initial oral report yesterday. The area of the incident was inspected at 3:00 am on January 31, 2024 and all water was properly contained. At 6:20 am operators observed water within the active reclamation cell. As previously mentioned, operators called supervision and immediately bermed the area. In order to estimate the volume of water going offsite, pipe flow calculations were used. Based on the full pipe flow calculations from the line for the timeframe between the last inspection and discovery is equal to 836,323 gallons. Some water was retained onsite within the northwest corner of the reclamation cell where the topsoil has not yet been returned and a portion of water went into the active pit. We are collecting the volume of water retained within this corner reclamation cell. Once we receive the survey data and conduct the calculations, we will subtract the onsite retained volume from the total volume from the pipe (836.323 gallons).

Should you have any questions please let me know.
